Introduction

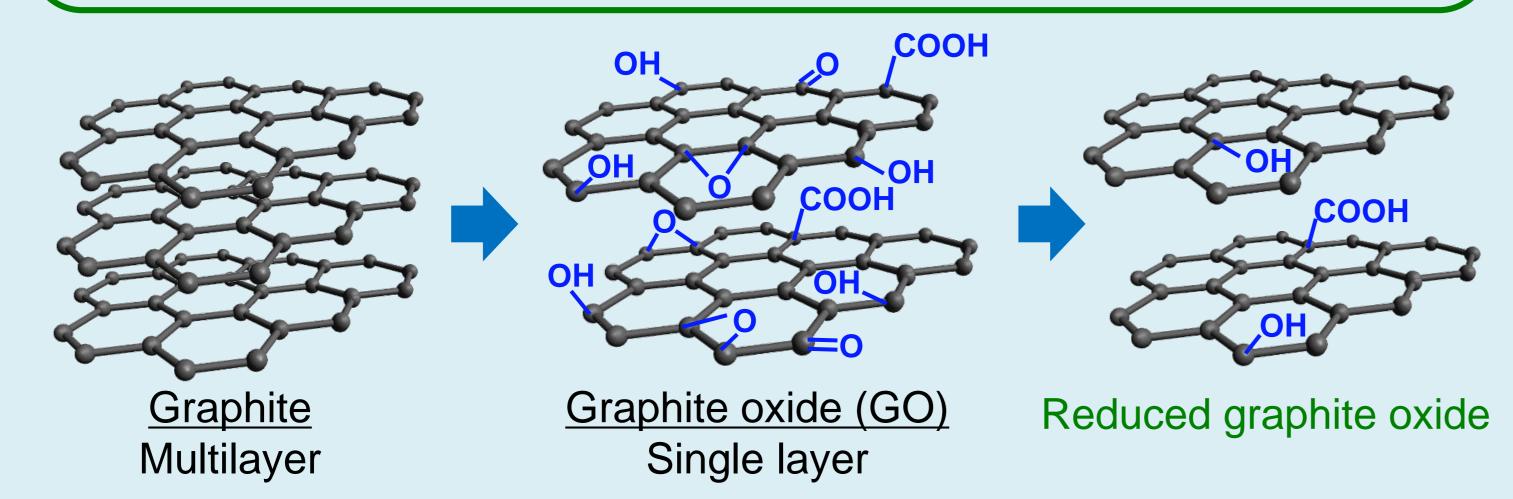

Graphene oxide (GO) was reduced by reductive radicals generated in liquid using the solution plasma method. The modification of the oxygen functional groups, the oxygen content, and the biding state of the carbon atom in GO were investigated using Fourier transform infrared spectroscopy (FT-IR) and X-ray photoelectron spectroscopy (XPS). The amount of oxygen functional groups including hydroxyl, carbonyl, and carboxyl groups decreased after plasma treatment. The ratio of carbon atoms to oxygen atoms in GO structure (C/O) increased from 2.53 to 2.75 with aqueous solution, and to 3.67 with ethanol solution.

Results and Conclusions

• Produced through the reduction of graphene oxide (GO), which is chemically synthesized from natural graphite.

Applications : Electrode of super capacitor, Catalyst of fuel cell

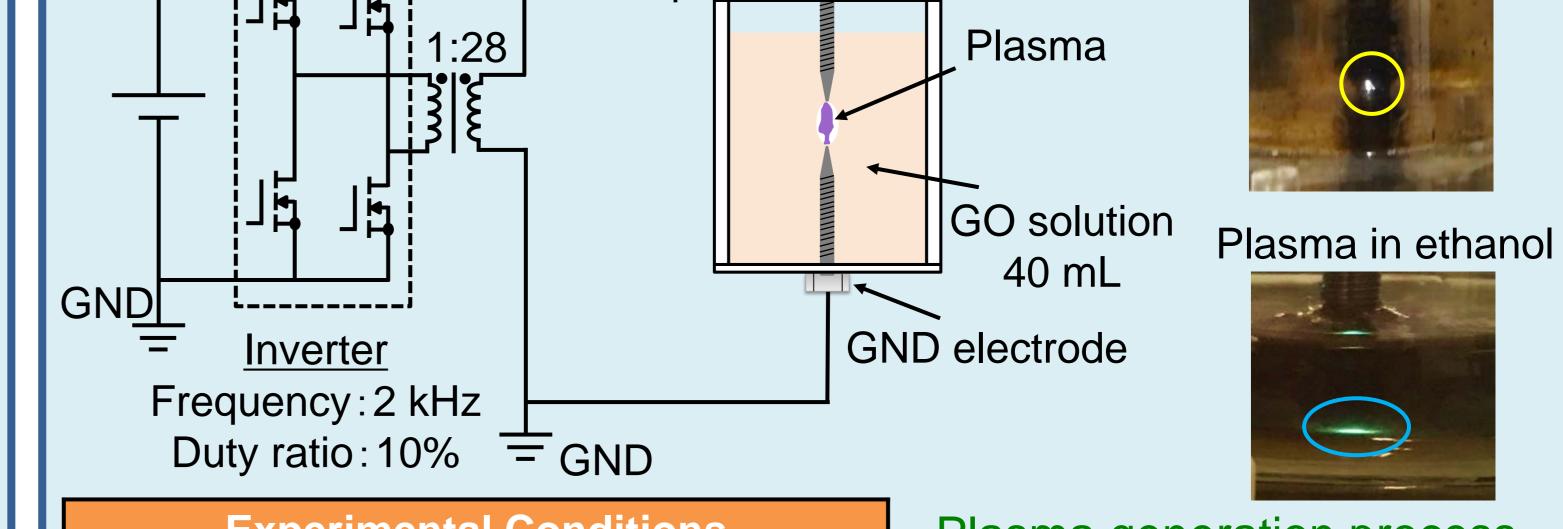

Conventional reducing methods in liquid

Chemical reduction $(N_2H_4, NaBH_4)$ • Solvothermal reduction

Solution Plasma Method

- ✓ Solution plasma is eco-friendly, energy-efficient, and can be done at normal temperature and pressure.
- GO is reduced by reactive species. And the reactive species to be generated depend on the solvent.

Investigation of reduction characteristics in various solvent is required.

Experimental Conditions		
Pure water	Ethanol	
50 mg/L	100 mg/L	
19 μS/cm	2.5 µS/cm	
2 mm	1 mm	
6 kV	4 kV	
33 W	5.2 W	
20 min	50 min	
	Pure water 50 mg/L 19 μS/cm 2 mm 6 kV 33 W	

 $H_2O \rightarrow \bullet OH + \bullet H$ $C_2H_5 - OH \rightarrow \bullet C_2H_4 - OH + \bullet H$

Plasma generation process -		
1.	Voltage is applied	
	between two electrodes.	
2.	Solvent is heated and	
	bubbles are produced.	
3	Breakdown occurs in	

bubbles and plasma is generated.

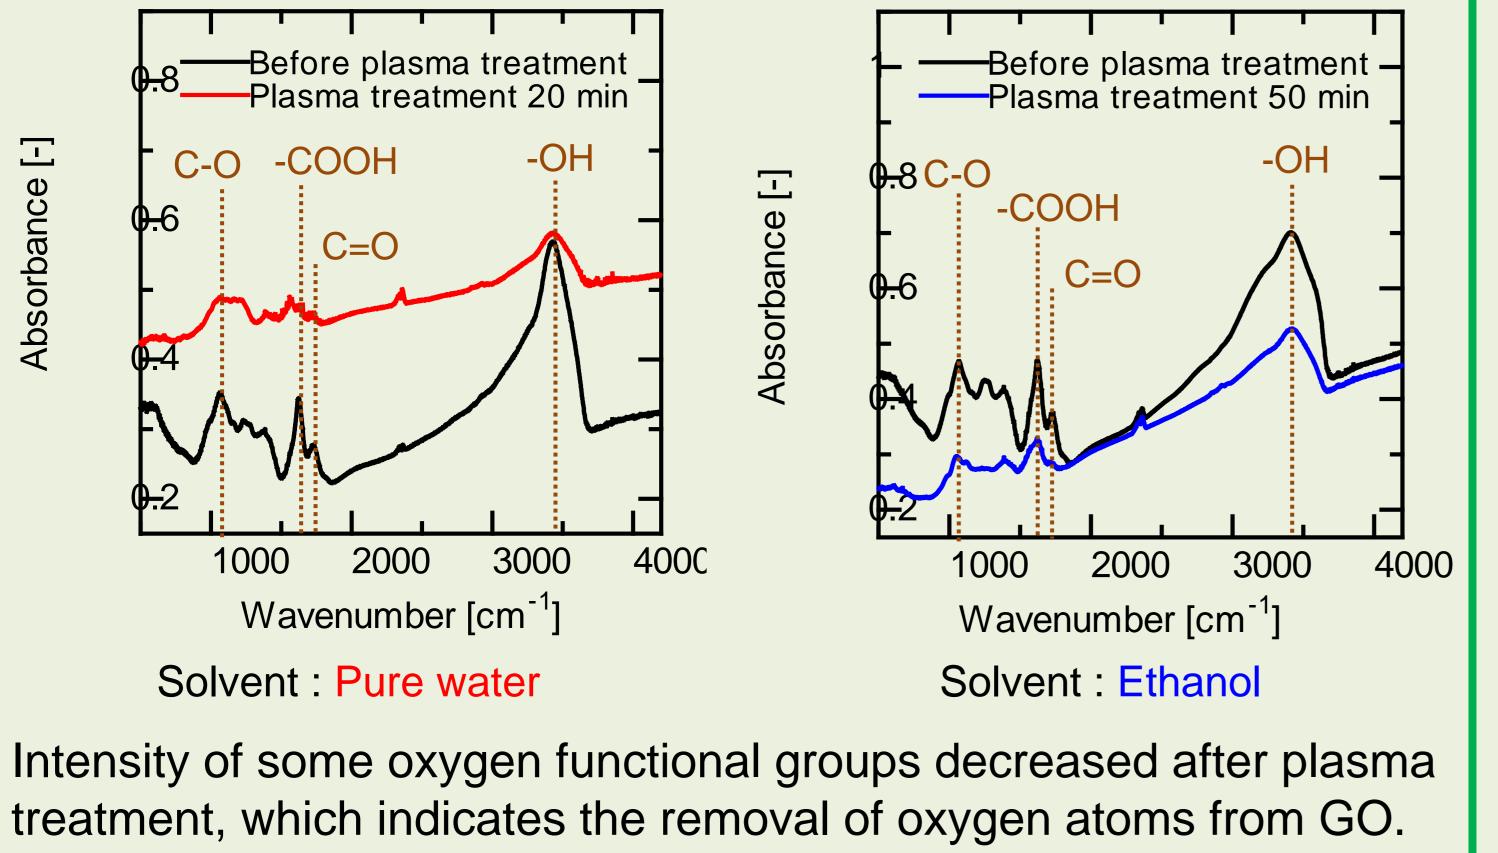

COOH

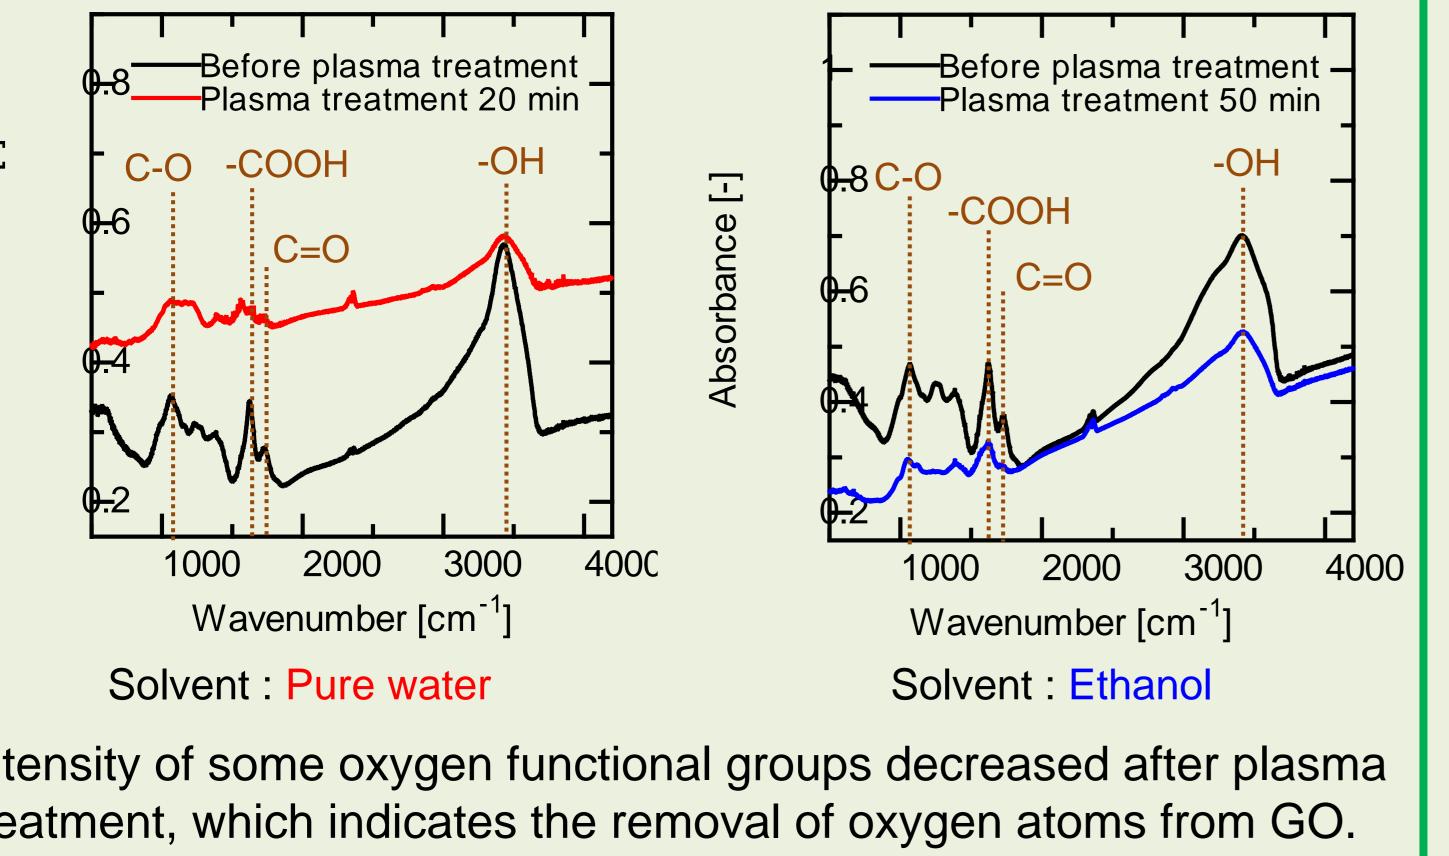

1. State of graphene oxide solution

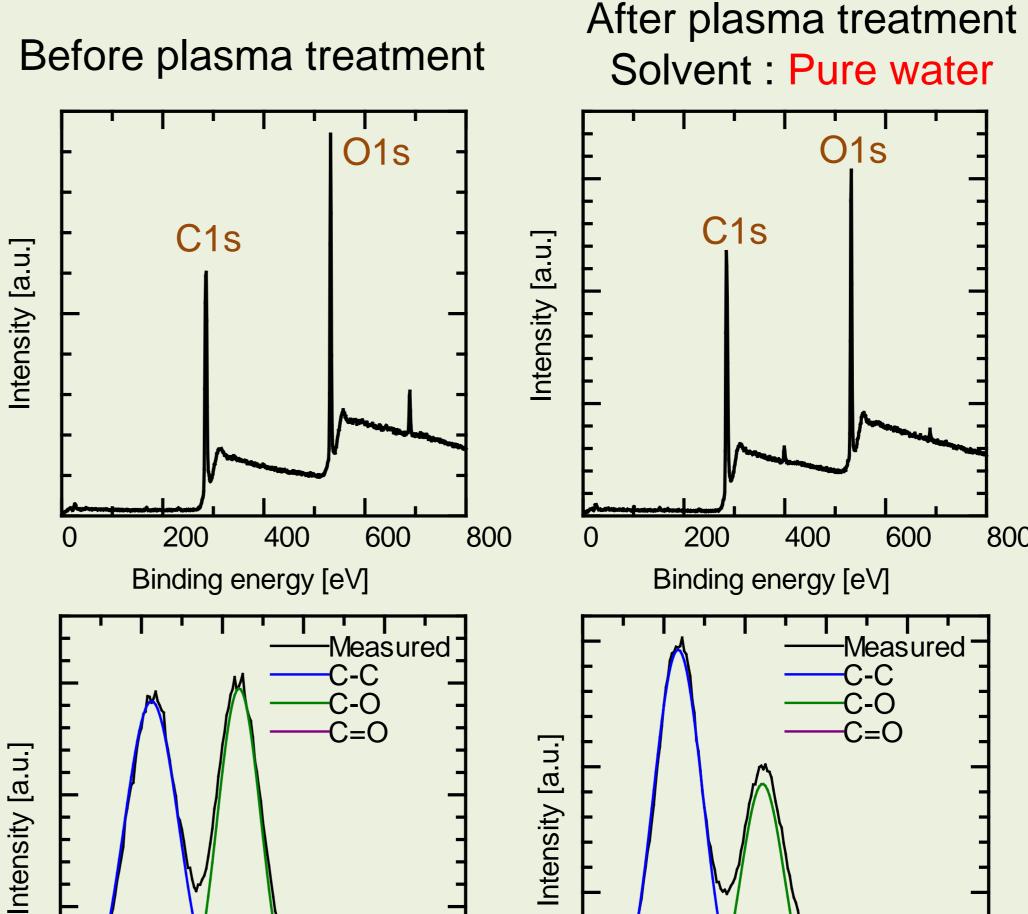

The color change of GO solution from brown to black indicates the structural change in GO through the reduction process.

2. FT-IR spectra

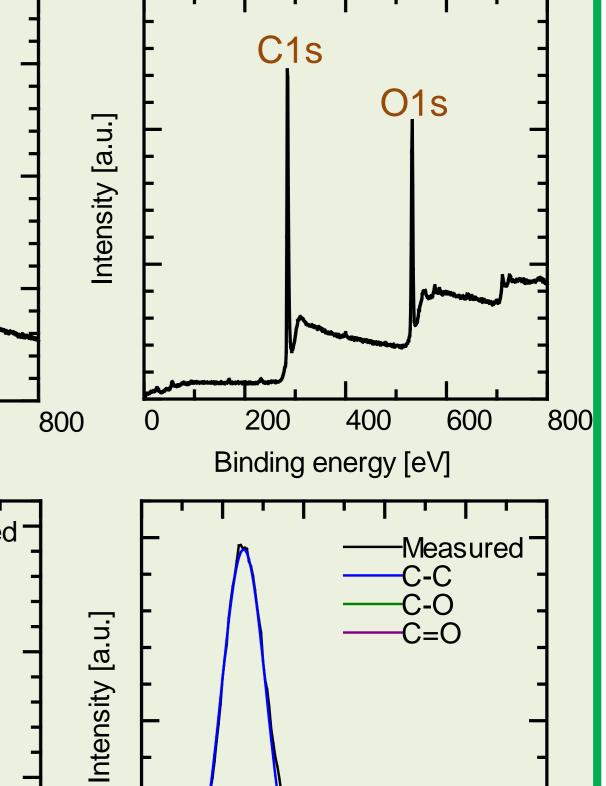

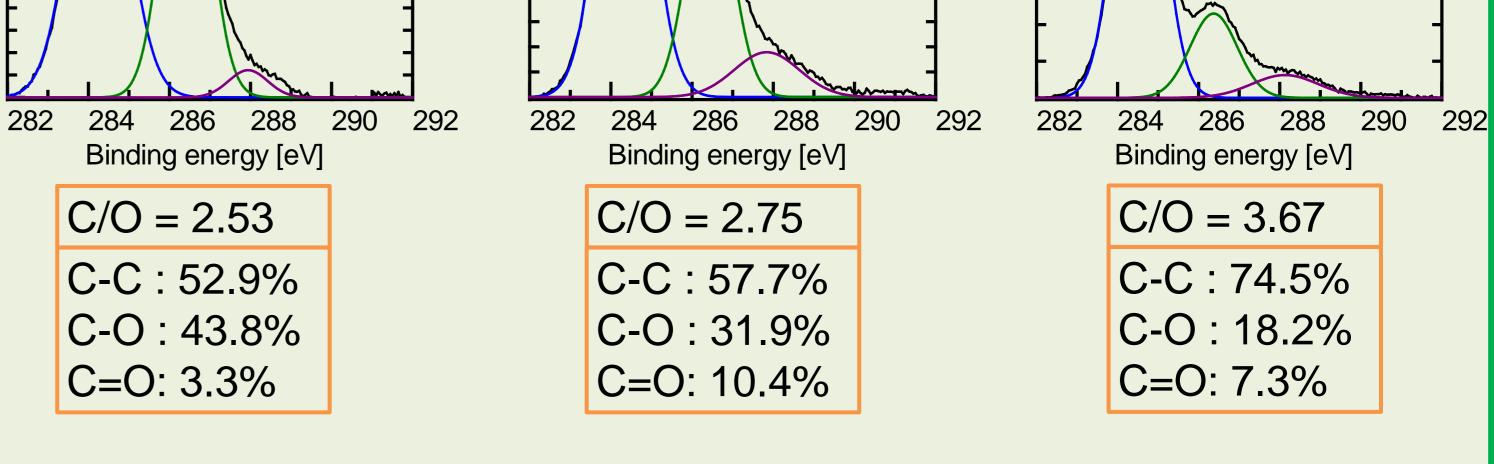

3. XPS survey spectra and C1s spectra

After plasma treatment Solvent : Ethanol

- \checkmark The atomic ratio (C/O) and the proportion of carbon to carbon bond (C-C) in GO increased in both solvent.
- ✓ Reduction rate is considered to increase by extending the plasma treatment time or by increasing the input power.
